Moon Hour

# 10-month-old sleep schedule

## An example day

| Time | What |
|---|---|
| 7:00 AM | Waking up |
| 10:00 AM – 11:15 AM | Nap 1 |
| 2:42 PM – 3:30 PM | Nap 2 |
| 7:30 PM | To bed for the night |

This is how Moon Hour might calculate on the first day if a child at 10 months wakes at 7 am and has no entries yet. It is an example, not a plan to follow: children are different, and the app adjusts the times to your child with every entry.

## At a glance

| | |
|---|---|
| **Sleep per 24 hours** | 12–16 hr |
| **Night** | 11 hr |
| **Naps** | 2 naps |
| **Awake time in between** | 3 hr – 4 hr |

Sleep in 24 hours: consensus of the American sleep physicians (AASM, Paruthi 2016) – a value for groups, not for an individual child. Wake windows: experience values from sleep consulting, which Moon Hour starts out with. There is no single recommendation for them, and experts disagree on whether fixed wake windows by age make sense (Canapari).

## Notes

## Sources

Moon Hour is a diary and planner that helps parents organise everyday life. Not a medical device; does not replace advice from a doctor or midwife.
